

## Information on Credit Card Customer Data

The Credit Card Customer Data that was used in this project comes from the sample data used in the Course Project for “Mastering Data Analysis in Excel” from Duke University which is Part of a 5-course series, the “Excel to MySQL: Analytic Techniques for Business Specialization” in Coursera.

The dataset contains 400 credit card customers with 100 defaulters and 300 non-defaulters.

There are six pieces of information that were provided for each customer:

- Age
- Years at current employer
- Years at current address
- Income over the past year
- Current credit card debt
- Current automobile debt.

The first column corresponds to the unique identifier for each customer and the last column corresponds to the outcome; 1 for default and 0 for non-default.

For more information on the data and the “Mastering Data Analysis in Excel” course, please go to <https://www.coursera.org/learn/analytics-excel/>.
